

Business Process Analysis and Design

Business processes are a sequence of operational tasks performed by an organisation. These processes streamline an organisation's individual activities for optimal use of its resources. Business process analysis and design provides a systematic approach to the enhancement of these business processes, to assist in the realisation of tangible benefits, such as reduced costs and effective allocation of resources. We provide our clients with the intelligence and strategic insight required to navigate the environment they operate in, by making use of industry best practices to align human and technical capital in bridging the gap between performance and an organisation's objectives. We study an organisation's business processes, and develop strategies that are aimed at:

- Improving productivity;
- Enhancing revenue;
- Increasing an organisation's effectiveness;
- Improving efficiencies; and
- Maximizing returns.

Whilst organisations have good methodologies and approaches to innovate products, it is much more difficult to innovate processes. Generally, process innovation is about redesigning processes to support the business strategy and also at the same time ensuring that all non-value adding processes are redesigned to add value. Innovation is regarded as a crucial factor for survival and competitive strength of organisations.

Information Management and Services

Information can be the main enabler of innovation. Management uses information in their planning, decision-making processes and for reporting. They aim to use information management to gain both efficiencies and differentiation. Information management plays a critical role in the dissemination of information at both strategic and operational levels.

Information management strategy is key to the strategies and objectives of an organisation. An effective information management strategy will ensure effective management of an organisation's information, and reduced inefficiencies, by allowing monitoring and prompt responses. We support our clients with efficient systems and processes that optimise and improve business processes. We source and provide advanced technologies that simplify automation, and business processes that help organisations meet an increasing demand for efficiency and sustainability. Information management is about the business processes that underpin the creation and use of information, and it encompasses technology, processes and people.

For organisations to remain relevant in this new environment, they must be able to implement the latest technologies, quickly. We ensure that when they do, they are engineered to work within their environment, and move as fast as the market requires. We adopt a business-led approach in implementing solutions that transform companies into more efficient and effective organisations that can address and sustain strategically directed change. We are forward-looking and well positioned to develop and drive innovation.
